

Kana Omni-Channel Media Planner

The Challenge

Modern media campaigns run across five or more platforms simultaneously. Each one has its own targeting interface, its own audience taxonomy, and its own configuration managed by a different team or agency. The result is a strategy that looks coherent on paper and falls apart in execution.

Three failure modes are frequently repeated for each brand:

- **Strategy gets lost in translation.** A campaign brief describes an audience in human terms. Platform targeting is configured in platform terms. The translation happens manually, inconsistently, and without any standard — so two people running the same campaign brief will produce meaningfully different targeting configurations.
- **Drift goes undetected.** Live campaigns get adjusted. Age ranges broaden. Interest categories get swapped. Each change seems minor in isolation. Weeks later, a \$2M campaign is reaching a fundamentally different audience than the brief intended — and no one knows until ROAS drops.
- **Budget allocation is guesswork.** Teams distribute spend across channels based on intuition and inertia. They can't answer the question that matters most: *at current spend levels, which channel generates the most value from the next dollar?* Without a model, they're optimizing blind.

Solution Overview: Omni-Channel Media Planner

The Solution

The Omni-Channel Media Planner is an AI-powered campaign intelligence platform that connects marketing strategy to media execution and keeps them connected throughout the campaign lifecycle.

Here are some details on what makes our approach to this challenge unique:

- **A shared canonical standard.** Most tools optimize within a single platform. The Omni-Channel Planner enforces consistency *across* platforms by mapping everything to a canonical audience taxonomy - 200+ segments covering interests, behaviors, demographics, and life stages across paid social, video, programmatic, and display. This becomes the common language between strategy and execution.
- **Traceability from brief to live configuration.** Every targeting decision is traceable back to the original brief. When something is off, you know exactly what drifted, where, and why — not a vague sense that performance has declined.
- **Models built from your data.** Budget recommendations are not generic benchmarks. They are fit to your brand's actual historical campaigns, per platform — so the model reflects your specific audience dynamics, not an industry average.

Who will benefit from the Omni-Channel Media Planner?

The Omni-Channel Media Planner is built for **CPG marketing and media teams** managing multi-platform campaigns with significant spend where inconsistent execution, undetected drift, and sub-optimal allocation translate directly into wasted budget and missed targets.

It is equally valuable for **media agencies** that need to enforce brief fidelity across client campaigns at scale, and for **marketing operations teams** that need audit-ready records of targeting decisions and performance rationale.

Solution Overview: Omni-Channel Media Planner

How It Works

- **Brief Analysis & Canonical Mapping** - Upload or paste a campaign brief and the planner extracts structured targeting intent: demographics, interests, behaviors, geographies, purchase patterns. It then maps that intent to a standardized audience taxonomy, producing consistent platform-specific targeting recommendations across paid social, video, programmatic, and display channels (including platforms like Meta, YouTube, TTD, and DV360) in seconds, not hours.
- **Audience Integrity Scoring** - For every live campaign, the planner continuously compares actual platform targeting configurations against the original brief. An Audience Integrity Score (0–100) quantifies alignment across four weighted dimensions: age targeting, behavioral signals, geography, and purchase logic. Drift is surfaced immediately with the specific segments that are missing or misaligned so teams can correct course before it impacts performance.
- **Media Mix Modeling & Budget Allocation** - The planner applies Media Mix Modeling (MMM) to historical campaign data, fitting saturation curves per channel that capture the relationship between spend and returns — including diminishing returns and ad carry-over effects. The result is a quantified marginal ROAS and saturation index for each platform, updated continuously as new campaign data comes in. Budget allocation recommendations are derived directly from these models, not from benchmarks or intuition. Teams can also run scenario plans at -20%, baseline, and +20% budget with projected outcomes per channel so when spend changes mid-flight, reallocation decisions are immediate and evidence-backed.

How You Benefit

Eliminate the gap between strategy and execution. With the Omni-Channel Media Planner, marketing teams no longer have to worry that their carefully crafted campaign briefs will be lost in translation as they move from strategy deck to live platform configuration. With every team member, agency partner, and platform specialists working from the same canonical standard, campaigns launch the way they were designed, every time.

Protect your investment with continuous audience integrity monitoring. The Omni-Channel Media Planner solves for campaign drift this by continuously scoring every live campaign

Solution Overview: Omni-Channel Media Planner

against its original brief across four key dimensions, surfacing exactly which segments have shifted and where. Teams gain the ability to catch and correct misalignment in real time, before it erodes performance, replacing the old model of periodic spot-checks and post-mortem surprises with always-on quality assurance that keeps campaigns on target throughout their lifecycle.

Make every budget dollar work harder with model-driven allocation. Instead of distributing spend across channels based on habit or gut feel, the Omni-Channel Media Planner fits saturation curves to your brand's own historical campaign data, quantifying marginal ROAS and diminishing returns for each platform as new performance data flows in. This gives teams a clear, evidence-backed answer to the most important question in media planning: where does the next dollar generate the most value? With the ability to run scenario plans at multiple budget levels and reallocate spend mid-flight based on real models rather than benchmarks, organizations can respond to changing conditions immediately and confidently turning budget optimization from a quarterly exercise into a continuous, data-driven discipline.

Why Kana?

Our technology connects your disparate data points and adapts to your specific brand requirements in real-time, enabling you to automate your specific experimentation and optimization workflows at a fundamental level.

Here are a few more ways in which we're proud to be unique:

Agentic AI Built by MarTech Architects: Our founding team has spent decades at the intersection of AdTech and MarTech

Data Governance and AI Policy Management: Centralized data governance and policy enforcement provides a layer of trust, satisfies AI security audits.

Insane Velocity Provides You With Speed to Action: We deploy instantly into your existing stack and move you from raw data to revenue-generating insights in minutes.

No Assembly Required: We eliminate the technical tax of AI by providing the builders, the logic, and the execution layers as a unified service.

Future-Proof Architecture: As your business changes, the agentic layer evolves to meet new challenges.

Ready to begin your agentic marketing era? [Get started today.](https://www.kana.ai)
