

Kana Synthetic Data

The Challenge

Your marketing and audience teams are held hostage by expensive, unreliable third-party data, or worse, flying blind in markets where no data exists at all.

- Privacy regulations and immature data ecosystems leave you with no demographic, behavioral, or socio-economic data to target audiences in new markets.
- Third-party data from providers like Experian, Transunion, and Acxiom is expensive, often inaccurate, and low quality; for example, a user can appear as both male and female in the same dataset.
- Lookalike models built on thin first-party seed data or poor third-party data produce unreliable audience segments, wasting ad spend on experimentation that doesn't convert.

Without quality audience data, you face a compounding cost problem: wasted media spend on poorly targeted campaigns, missed product launch windows in high-growth markets, and continued dependency on third-party vendors whose data degrades your ROI rather than improving it. For publishers, this same data gap limits the audiences you can offer advertisers, eroding your competitive position and ad revenue.

The Solution

Kana's Synthetic Data Generation uses proprietary knowledge graphs and fine-tuned generative models to create high-fidelity synthetic user data, enabling brands to launch in data-poor markets and extend reach without third-party data, and publishers to augment their first-party datasets with rich audience attributes on demand.

Solution Overview: Kana Campaign Management

How It Works

Kana's Synthetic Data Generation application:

- Ingests your product launch materials, campaign parameters, and available first-party data
- Builds a proprietary knowledge graph from public datasets (census, socio-economic data, Google Trends, Amazon Reviews, YouGov surveys) and your connected first-party sources
- Fine-tunes a Synthetic User Data Generation Model tailored to your market, product, and audience goals
- Produces a synthetic user universe - a rich matrix of user attributes - that feeds Kana's Experimentation Engine and Lookalike Model
- Simulates user engagement across your selected media platforms (Meta, Google/YT, TikTok, TradeDesk) to identify high-performing activatable segments
- Incorporates planner feedback and campaign performance data in a continuous loop, dynamically adjusting audience definitions in-flight

How You Benefit

- Launch products in new markets with zero seed data and no third-party dependency
- Extend audience reach at scale using synthetic lookalikes that match or exceed third-party data quality
- Reduce or eliminate costly third-party data spend while maintaining targeting precision
- Activate audience segments directly in Meta, Google, TikTok, and TradeDesk with platform-ready definitions
- Continuously optimize audience targeting through real-time campaign performance feedback loops
- Augment first-party user profiles with rich synthetic attributes (demographics, interests, purchase intent) to meet any advertiser brief
- Achieve 80%+ overlap with traditional third-party audiences at a fraction of the cost

Solution Overview: Kana Campaign Management

Why Kana?

For decades, you've been forced to choose between rigid off-the-shelf software or slow, expensive custom builds. Kana represents the third way. We employ faster, AI-native engineering methodology to deliver high-precision software that is inherently fluid. We engineer the product around your unique customer journey, **giving you the precision of a custom build with the scale of enterprise SaaS.**

Our technology connects your disparate data points and adapts to your specific brand requirements in real-time, enabling you to automate your specific experimentation and optimization workflows at a fundamental level.

Here are a few more ways in which we're proud to be unique:

Agentic AI Built by MarTech Architects: Our founding team has spent decades at the intersection of AdTech and MarTech

Data Governance and AI Policy Management: Centralized data governance and policy enforcement provides a layer of trust, satisfies AI security audits.

Insane Velocity Provides You With Speed to Action: We deploy instantly into your existing stack and move you from raw data to revenue-generating insights in minutes.

No Assembly Required: We eliminate the technical tax of AI by providing the builders, the logic, and the execution layers as a unified service.

Future-Proof Architecture: As your business changes, the agentic layer evolves to meet new challenges.

Ready to begin your agentic marketing era? [Get started today.](https://www.kana.ai)
